

# Net Plan

— Customizable Report Generation for Network Planners —

The NAMS® Centralized Net Plan Module is a multifunctional dynamic reports generator that allows network planners to compose their own reports. Each call record within NAMS® contains the associated LERG information to enhance report generation. With an easy and intuitive user interface, NetPlan allows the user to compose reports based on custom selectable criteria and fashion the output report with user selectable field and format information. Rather than the traditional canned reports that most systems offer, NetPlan provides report flexibility that only a true 'report generator' can. Reports can be run on-the-fly or can be designed, saved and scheduled to report on pre-defined periods and ran at user selectable times with email delivery of the reports.
